

RightZAP1.1 DNA

The RightZAP1.1 DNA is a 32.4 kb linear DNA fragment that encompasses bp 3504-right end of the Ad5 genome. The E3 region is intact (WT). The DNA was purified from a cosmid. It is used in combination with the shuttle vectors pZAP1.1 or pZAP1.2 to construct replication-deficient adenoviruses containing transgenes in place of the E1 region of the Ad5 genome. The maximum transgene capacity of the resulting virus is 5.2 kb.
